In addition, the Ministry of Education acknowledges the guidance of:

- program team members
- focus groups of teachers
- other educators and reviewers.
Introduction

Foundations of Mathematics and Pre-calculus 10 is to be allocated 100 hours. It is important for students to receive the full amount of time allocated to their mathematical learning and that the learning be focused upon students attaining the understanding and skills as defined by the outcomes and indicators stated in this curriculum.

The outcomes in the Foundations of Mathematics and Pre-calculus 10 course are based upon the students’ prior learning and continue to develop their number sense, spatial sense, logical thinking, and understanding of mathematics as a human endeavour. These learning experiences prepare students to be confident, flexible, and capable with their mathematical knowledge in new contexts. The outcomes in this course are the prerequisite outcomes for both the Foundations of Mathematics 20 and Pre-calculus 20 courses.

The outcomes in this curriculum define content that is considered a high priority in fields of study and areas of work for which the Foundations of Mathematics or Pre-calculus pathways are required. The outcomes represent the ways of thinking or behaving like a mathematics discipline area expert in those fields of study or areas of work.

Indicators are included for each of the outcomes in order to clarify the breadth and depth of learning intended by the outcome. These indicators are a representative list of the kinds of things a student needs to understand and/or be able to do in order to achieve the learning intended by the outcome. New and combined indicators, which remain within the breadth and depth of the outcome, can and should be created by teachers to meet the needs and circumstances of their students and communities.

This curriculum’s outcomes and indicators have been designed to address current research in mathematics education as well as the needs of Saskatchewan students. The Foundations of Mathematics and Pre-calculus 10 outcomes are based upon the renewed Western and Northern Canadian Protocol’s (WNCP) The Common Curriculum Framework for 10-12 Mathematics (2008).

Within the outcomes and indicators in this curriculum, the terms “including” and “such as”, as well as the abbreviation “e.g.,” occur. The use of each term serves a specific purpose. The term “including” prescribes content, contexts, or strategies that students must experience in their learning, without excluding other possibilities. For example, consider the indicator “Provide referents for linear measurements, including millimetre, centimetre, metre, kilometre, inch, foot, yard, and mile, and explain the choices.” Here, it is expected that students provide referents for all of the units of linear measurement listed. Other units, such as a decameter, could also be added but it is not expected by the indicator or outcome.
The term “such as” provides examples of possible broad categories of content, contexts, or strategies that teachers or students may choose, without excluding other possibilities. For example, consider the indicator “Represent, such as through the use of a graphic organizer, the relationships among the subsets of the Real numbers: natural, whole, integer, rational, and irrational.” Here, a specific type of graphic organizer is not given, nor is the use of a graphic organizer considered a mandatory form of representation.

Finally, the abbreviation “e.g.,” offers specific examples of what a term, concept, or strategy might look like. For example, consider the indicator “Match corresponding representations of linear relations (e.g., situations, graphs, tables of values, equations, and sets of ordered pairs).” In this case, the listed types of representations are specific types of examples, but they are not mandatory.

Also included in this curriculum is information regarding how the Foundations of Mathematics and Pre-calculus 10 course connects to the K-12 goals for mathematics. These goals (page 8) define the purpose of mathematics education for Saskatchewan students.

In addition, teachers will find discussions of the critical characteristics of mathematics education, inquiry in mathematics, and assessment and evaluation of student learning in mathematics.

Grades 10 - 12 Mathematics Framework

Saskatchewan’s grade 10 to 12 mathematics curricula are based upon the Western and Northern Canadian Protocol’s (WNCP) The Common Curriculum Framework (CCF) for Grades 10 - 12 Mathematics (2008). This framework was developed in response to data collected from WNCP post-secondary institutions and business and industry sectors regarding the mathematics needed by students for different disciplines, areas of study, and work areas. From this data, there emerged groupings of areas which required the same types of mathematics. Each grouping also required distinct mathematics, so that even if the same topic was needed in more than one of the groupings, it needed to be addressed in different ways for different groups.

The result was the creation of a set of pathways consisting of a single grade 10, 11, and 12 course for each of these groups which were named Workplace and Apprenticeship Mathematics, Pre-calculus, and Foundations of Mathematics. During the defining of the content for these pathways and courses, it became evident that the content for Grade 10 Foundations of Mathematics and Grade 10 Pre-calculus was very similar. The result was the merging of the two Grade 10 courses (Foundations of Mathematics, and Pre-calculus) into a single course entitled Foundations of Mathematics and Pre-calculus 10. The
The following chart visually illustrates the courses in each pathway and their relationship to each other.

**10-12 Mathematics Pathways Framework**

It is important to note that there are no arrows connecting courses in different pathways. This is because the content is different between the pathways, so students wishing to change pathways need to first get the prerequisite courses for the pathway. For example, if students are in or have taken Grade 11 Pre-calculus, they cannot move directly into either Grade 12 Foundations of Mathematics or Grade 12 Workplace and Apprenticeship Mathematics. In addition, if students have not already taken Workplace and Apprenticeship Mathematics 10, they must do so before entering into Workplace and Apprenticeship Mathematics 20.

Each course in each pathway is to be taught and learned to the same level of rigour. No pathway or course is considered “easy math”. Rather, all pathways and courses present “different maths” for different purposes.

Students may take courses from more than one pathway for credit. The current credit requirements for graduation from grade 12 are: one 10 level credit and one 20 level credit in mathematics.
The Ministry of Education recommends that grade 10 students take both grade 10 courses to give the students an idea of what the mathematics in each pathway is like. This will also make transitions easier for those students who wish to change pathways part way through their high school years.

Core Curriculum

Core Curriculum is intended to provide all Saskatchewan students with an education that will serve them well regardless of their choices after leaving school. Through its components and initiatives, Core Curriculum supports the achievement of the Goals of Education for Saskatchewan. For current information regarding Core Curriculum, please refer to Core Curriculum: Principles, Time Allocations, and Credit Policy (2009) on the Ministry of Education website. For additional information related to the components and initiatives of Core Curriculum, please refer to the Ministry website (http://www.education.gov.sk.ca/policy) for various policy and foundation documents, including the following:

- Renewed Objectives for the Common Essential Learnings of Critical and Creative Thinking (CCT) and Personal and Social Development (PSD) (2008)
- Policy and Procedures for Locally-developed Courses of Study (2004)
- Diverse Voices: Selecting Equitable Resources for Indian and Métis Education (2005)
Broad Areas of Learning

There are three Broad Areas of Learning that reflect Saskatchewan’s Goals of Education. K-12 mathematics contributes to the Goals of Education through helping students achieve knowledge, skills, and attitudes related to these Broad Areas of Learning.

Lifelong Learners

Students who are engaged in constructing and applying mathematical knowledge naturally build a positive disposition towards learning. Throughout their study of mathematics, students should be learning the skills (including reasoning strategies) and developing the attitudes that will enable the successful use of mathematics in daily life. Moreover, students should be developing understandings of mathematics that will support their learning of new mathematical concepts and applications that may be encountered within both career and personal interest choices. Students who successfully complete their study of K-12 mathematics should feel confident about their mathematical abilities and have developed the knowledge, understandings, and abilities necessary to make future use and/or studies of mathematics meaningful and attainable.

In order for mathematics to contribute to this Broad Area of Learning, students must actively learn the mathematical content in the outcomes through using and developing logical thinking, number sense, spatial sense, and understanding of mathematics as a human endeavour (the four goals of K-12 mathematics). It is crucial that the students discover the mathematics outlined in the curriculum rather than the teacher covering it.

Sense of Self, Community, and Place

To learn mathematics with deep understanding, students not only need to interact with the mathematical content, but with each other as well. Mathematics needs to be taught in a dynamic environment where students work together to share and evaluate strategies and understandings. Students who are involved in a supportive mathematics learning environment that is rich in dialogue and reflection are exposed to a wide variety of perspectives and strategies from which to construct a sense of the mathematical content. In such an environment, students also learn and come to value how they, as individuals and as members of a group or community, can contribute to understanding and social well-being through a sense of accomplishment, confidence, and relevance. When encouraged to present ideas representing different perspectives and ways of knowing, students in mathematics classrooms develop a deeper understanding of the mathematics. At the same time, students also learn to respect and value the contributions of others.
Mathematics provides many opportunities for students to enter into communities beyond the classroom by engaging with people in the neighbourhood or around the world. By working towards developing a deeper understanding of mathematics and its role in the world, students develop their personal and social identity, and learn healthy and positive ways of interacting and working together.

**Engaged Citizens**

Mathematics brings a unique perspective and way of knowing to the analysis of social impact and interdependence. Doing mathematics requires students to “leave their emotions at the door” and to engage in different situations for the purpose of understanding what is really happening and what can be done. Mathematical analysis of topics that interest students, such as trends in climate change, homelessness, health issues (e.g., hearing loss, carpal tunnel syndrome, diabetes), and discrimination can be used to engage the students in interacting and contributing positively to their classroom, school, community, and world. With the understandings that students derive through mathematical analysis, they become better informed and have a greater respect for and understanding of differing opinions and possible options. With these understandings, students can make better informed and more personalized decisions regarding roles within, and contributions to, the various communities in which students are members.

**Cross-curricular Competencies**

The Cross-curricular Competencies are four interrelated areas containing understandings, values, skills, and processes which are considered important for learning in all areas of study. These competencies reflect the Common Essential Learnings and are intended to be addressed in each area of study at each grade level.

**Developing Thinking**

It is important that, within their study of mathematics, students are engaged in personal construction and understanding of mathematical knowledge. This occurs most effectively through student engagement in inquiry and problem solving when students are challenged to think critically and creatively. Moreover, students need to experience mathematics in a variety of contexts — both real world applications and mathematical contexts — in which students are asked to consider questions such as “What would happen if...”, “Could we find...”, and “What does this tell us?” Students need to be engaged in the social construction of mathematics to develop an understanding and appreciation of mathematics as a tool which can be used to consider...
different perspectives, connections, and relationships. Mathematics is a subject that depends upon the effective incorporation of independent work and reflection with interactive contemplation, discussion, and resolution.

Developing Identity and Interdependence
Given an appropriate learning environment in mathematics, students can develop both their self-confidence and self-worth. An interactive mathematics classroom in which the ideas, strategies, and abilities of individual students are valued supports the development of personal and mathematical confidence. It can also help students take an active role in defining and maintaining the classroom environment and accepting responsibility for the consequences of their choices, decisions, and actions. A positive learning environment combined with strong pedagogical choices that engage students in learning serves to support students in behaving respectfully towards themselves and others.

Developing Literacies
Through their mathematical learning experiences, students should be engaged in developing their understandings of the language of mathematics and their ability to use mathematics as a language and representation system. Students should be regularly engaged in exploring a variety of representations for mathematical concepts and should be expected to communicate in a variety of ways about the mathematics being learned. Important aspects of learning mathematical language are to make sense of mathematics, communicate one’s own understandings, and develop strategies to explore what and how others know about mathematics. Moreover, students should be aware of and able to make the appropriate use of technology in mathematics and mathematics learning. It is important to encourage students to use a variety of forms of representation (concrete manipulatives, physical movement, oral, written, visual, and symbolic) when exploring mathematical ideas, solving problems, and communicating understandings.

All too often, it is assumed that symbolic representation is the only way to communicate mathematically. The more flexible students are in using a variety of representations to explain and work with the mathematics being learned, the deeper students’ understanding becomes.

Developing Social Responsibility
As students progress in their mathematical learning, they need to experience opportunities to share and consider ideas, and resolve conflicts between themselves and others. This requires that the

K-12 Goals for Developing Identity and Interdependence:

• Understanding, valuing, and caring for oneself (intellectually, emotionally, physically, spiritually)
• Understanding, valuing, and caring for others
• Understanding and valuing social, economic, and environmental interdependence and sustainability.
Related to CELs of Personal and Social Development and Technological Literacy.

K-12 Goals for Developing Literacies:

• Constructing knowledge related to various literacies
• Exploring and interpreting the world through various literacies
• Expressing understanding and communicating meaning using various literacies.
Related to CELs of Communication, Numeracy, Technological Literacy, and Independent Learning.
K-12 Goals for Developing Social Responsibility:

- Using moral reasoning processes
- Engaging in communitarian thinking and dialogue
- Taking social action.

Related to CELs of Communication, Critical and Creative Thinking, Personal and Social Development, and Independent Learning.

A learning environment constructed by the teacher and students support respectful, independent, and interdependent behaviours. Every student should feel empowered to help others in developing their understanding, while finding respectful ways to seek help from others. By encouraging students to explore mathematics in social contexts, students can be engaged in understanding the situation, concern, or issue and then in planning for responsible reactions or responses. Mathematics is a subject dependent upon social interaction and, as a result, social construction of ideas. Through the study of mathematics, students learn to become reflective and positively contributing members of their communities. Mathematics also allows for different perspectives and approaches to be considered, assessed for contextual validity, and strengthened.

K-12 Aim and Goals of Mathematics

The K-12 aim of the mathematics program is to have students develop the understandings and abilities necessary to be confident and competent in thinking and working mathematically in their daily activities, ongoing learning, and work experiences. The K-12 mathematics program is intended to stimulate the spirit of inquiry within the context of mathematical thinking and reasoning.

Defined below are four K-12 goals for mathematics in Saskatchewan. The goals are broad statements that identify the characteristics of thinking and working mathematically. At every grade level, students’ learning should be building towards their attainment of these goals. Within each grade level, outcomes are directly related to the development of one or more of these goals. The instructional approaches used to promote student achievement of the grade level outcomes must, therefore, also promote student achievement with respect to the K-12 goals.

Logical Thinking

Through their learning of K-12 mathematics, students will develop and be able to apply mathematical reasoning processes, skills, and strategies to new situations and problems.

This goal encompasses processes and strategies that are foundational to understanding mathematics as a discipline. These processes and strategies include:

- observing
- inductive and deductive thinking
- proportional reasoning
- abstracting and generalizing
- exploring, identifying, and describing patterns
• verifying and proving
• exploring, identifying, and describing relationships
• modeling and representing (including concrete, oral, physical, pictorial, and symbolic representations)
• conjecturing and asking “what if” (mathematical play).

In order to develop logical thinking, students need to be actively involved in constructing their mathematical knowledge using the above strategies and processes. Inherent in each of these strategies and processes is student communication and the use of, and connections between, multiple representations.

**Number Sense**

Through their learning of K-12 mathematics, students will develop an understanding of the meaning of, relationships between, properties of, roles of, and representations (including symbolic) of numbers and apply this understanding to new situations and problems.

Foundational to students developing number sense is having ongoing experiences with:

• decomposing and composing of numbers
• relating different operations to each other
• modeling and representing numbers and operations (including concrete, oral, physical, pictorial, and symbolic representations)
• understanding the origins and need for different types of numbers
• recognizing operations on different number types as being the same operations
• understanding equality and inequality
• recognizing the variety of roles for numbers
• developing and understanding algebraic representations and manipulations as an extension of numbers
• looking for patterns and ways to describe those patterns numerically and algebraically.

Number sense goes well beyond being able to carry out calculations. In fact, in order for students to become flexible and confident in their calculation abilities, and to be able to transfer those abilities to more abstract contexts, students must first develop a strong understanding of numbers in general. A deep understanding of the meaning, roles, comparison, and relationship between numbers is critical to the development of students’ number sense and their computational fluency.
Spatial Sense
Through their learning of K-12 mathematics, students will develop an understanding of 2-D shapes and 3-D objects, and the relationships between geometrical shapes and objects and numbers, and apply this understanding to new situations and problems.

Development of a strong spatial sense requires students to have ongoing experiences with:

• construction and deconstruction of 2-D shapes and 3-D objects
• investigations and generalizations about relationships between 2-D shapes and 3-D objects
• explorations and abstractions related to how numbers (and algebra) can be used to describe 2-D shapes and 3-D objects
• explorations and generalizations about the movement of 2-D shapes and 3-D objects
• explorations and generalizations regarding the dimensions of 2-D shapes and 3-D objects
• explorations, generalizations, and abstractions about different forms of measurement and their meaning.

Being able to communicate about 2-D shapes and 3-D objects is foundational to students’ geometrical and measurement understandings and abilities. Hands-on exploration of 3-D objects and the creation and testing of conjectures based upon patterns that are discovered should drive the students’ development of spatial sense, with formulas and definitions resulting from the students’ mathematical learnings.

Mathematics as a Human Endeavour
Through their learning of K-12 mathematics, students will develop an understanding of mathematics as a way of knowing the world that all humans are capable of with respect to their personal experiences and needs.

Developing an understanding of mathematics as a human endeavour requires students to engage in experiences that:

• value place-based knowledge and learning
• value learning from and with community
• encourage and value varying perspectives and approaches to mathematics
• recognize and value one’s evolving strengths and knowledge in learning and doing mathematics
• recognize and value the strengths and knowledge of others in doing mathematics
• value and honour reflection and sharing in the construction of mathematical understanding
• recognize errors as stepping stones towards further learning in mathematics
• require self-assessment and goal setting for mathematical learning
• support risk taking (mathematical and personal)
• build self-confidence related to mathematical insights and abilities
• encourage enjoyment, curiosity, and perseverance when encountering new problems
• create appreciation for the many layers, nuances, perspectives, and value of mathematics.

Students should be encouraged to challenge the boundaries of their experiences, and to view mathematics as a set of tools and ways of thinking that every society develops to meet their particular needs. This means that mathematics is a dynamic discipline in which logical thinking, number sense, and spatial sense form the backbone of all developments and those developments are determined by the contexts and needs of the time, place, and people.

Meaning does not reside in tools; it is constructed by students as they use tools.
(Hiebert, Carpenter, Fennema, Fuson, Wearne, Murry, Olivier, & Hunman, 1997, p. 10)
The content found within the grade level outcomes for the K-12 mathematics program, and its applications, is first and foremost the vehicle through which students can achieve the four K-12 goals of mathematics. Attainment of these four goals will result in students with the mathematical confidence and tools necessary to succeed in future mathematical endeavours.

Teaching Mathematics

At the National Council of Teachers of Mathematics (NCTM) Canadian Regional Conference in Halifax (2000), Marilyn Burns said in her keynote address, “When it comes to mathematics curricula there is very little to cover, but an awful lot to uncover [discover]”. This statement captures the essence of the ongoing call for change in the teaching of mathematics. Mathematics is a dynamic and logic-based language that students need to explore and make sense of for themselves. For many teachers, parents, and former students, this is a marked change from the way mathematics was taught to them. Research and experience indicate there is a complex, interrelated set of characteristics that teachers need to be aware of in order to provide an effective mathematics program.

Assumptions in this Curriculum

The question in mathematics often arises as to whether students should work with fractions, decimals, or both, and if working with fractions should mixed numbers or improper fractions be used. For the purposes of this document, we will assume the following:

- If a question or problem is stated with fractions (decimals), the solution should involve fractions (decimals) unless otherwise stated.
- Final fraction solutions can be stated in mixed numbers or improper fractions as long as they are consistent with the original stating of the question or problem.

In addition, this curriculum assumes that when engaging in activities related to graphing, the word “sketch” should be used to indicate that the graph can be produced without the use of specific tools or an emphasis on precision. The word “draw” should be used to indicate that specific tools (such as graphing software or graph paper) should be used to produce a graph of greater accuracy.

Critical Characteristics of Mathematics Education

The following sections in this curriculum highlight some of the different facets for teachers to consider in the process of changing
from covering to supporting students in discovering mathematical concepts. These facets include:

- the organization of the outcomes
- the seven mathematical processes
- the difference between covering and discovering mathematics
- the development of mathematical terminology
- First Nations and Métis learners and mathematics
- critiquing statements
- the concrete to abstract continuum
- modelling and making connections
- the role of homework
- the importance of ongoing feedback and reflection

**Organization of Outcomes**

The content of K-12 mathematics can be organized in a variety of ways. In the grades 10-12 curricula, the outcomes are not grouped according to strands (as in the elementary mathematics curricula) or by topic (as in past curricula). The primary reasons for this are: a succinct set of high level outcomes for each grade, and variation between grades and pathways in terms of the topics and content within different courses. For ease of reference, the outcomes in this curriculum are numbered using the following system: FP10.#, where # is the number of the outcome in the list of outcomes. It should be noted, for example, that FP10.1 need not be taught before FP10.10. Teachers are encouraged to design learning activities that integrate outcomes from throughout the curriculum so that students develop a comprehensive and connected view of mathematics rather than viewing mathematics as a set of compartmentalized ideas and separate topics. The ordering and grouping of the outcomes in Foundations of Mathematics and Pre-calculus 10 is at the discretion of the teacher.

**Mathematical Processes**

This Foundations of Mathematics and Pre-calculus 10 curriculum recognizes seven processes inherent in the teaching, learning, and doing of mathematics. These processes focus on: communicating, making connections, mental mathematics and estimating, problem solving, reasoning, and visualizing, along with using technology to integrate these processes into the mathematics classroom to help students learn mathematics with deeper understanding.

The outcomes in mathematics should be addressed through the appropriate mathematical processes as indicated by the bracketed letters following each outcome. During planning, teachers should carefully consider those processes indicated as being important to supporting student achievement of the respective outcomes.
Communication [C]

Students need opportunities to read about, represent, view, write about, listen to, and discuss mathematical ideas using both personal and mathematical language and symbols. These opportunities allow students to create links among their own language, ideas, prior knowledge, the formal language and symbols of mathematics, and new learning.

Communication is important in clarifying, reinforcing, and adjusting ideas, attitudes, and beliefs about mathematics. Students should be encouraged to use a variety of forms of communication while learning mathematics. Students also need to communicate their learning using mathematical terminology, but only when they have had sufficient experience to develop an understanding of that terminology.

Concrete, pictorial, symbolic, physical, verbal, written, and mental representations of mathematical ideas should be encouraged and used to help students make connections and strengthen their understandings.

Connections [CN]

Contextualization and making connections to the experiences of learners are powerful processes in developing mathematical understanding. When mathematical ideas are connected to each other or to other real-world phenomena, students begin to view mathematics as useful, relevant, and integrated.

The brain is constantly looking for and making connections. Learning mathematics within contexts and making connections relevant to learners can validate past experiences and prior knowledge, and increase student willingness to participate and be actively engaged.

Mental Mathematics and Estimation [ME]

Mental mathematics is a combination of cognitive strategies that enhance flexible thinking and number sense. It is calculating mentally and reasoning about the relative size of quantities without the use of external memory aids. Mental mathematics enables students to determine answers and propose strategies without paper and pencil. It improves computational fluency and problem solving by developing efficiency, accuracy, and flexibility.

Estimation is a strategy for determining approximate values of quantities, usually by referring to benchmarks or using referents, or for determining the reasonableness of calculated values. Students need to know how, when, and what strategy to use when estimating.

Estimation is used to make mathematical judgements and develop useful, efficient strategies for dealing with situations in daily life.
Problem Solving [PS]
Learning through problem solving should be the focus of mathematics at all grade levels. When students encounter new situations and respond to questions of the type, “How would you ...?”, “Can you ...?”, or “What if ...?”, the problem solving approach is being modelled. Students develop their own problem-solving strategies by being open to listening, discussing, and trying different strategies.

In order for an activity to be problem-solving based, it must ask students to determine a way to get from what is known to what is sought. If students have already been given ways to solve the problem, it is not problem solving but practice. A true problem requires students to use prior learning in new ways and contexts. Problem solving requires and builds depth of conceptual understanding and student engagement.

Problem solving is a powerful teaching tool that fosters multiple and creative solutions. Creating an environment where students actively look for, and engage in, finding a variety of strategies for solving problems empowers students to explore alternatives and develops confidence, reasoning, and mathematical creativity.

Reasoning [R]
Mathematical reasoning helps students think logically and make sense of mathematics. Students need to develop confidence in their abilities to reason and explain their mathematical thinking. Meaningful inquiry challenges students to think and develop a sense of wonder about mathematics.

Mathematical experiences in and out of the classroom should provide opportunities for students to engage in inductive and deductive reasoning. Inductive reasoning occurs when students explore and record results, analyze observations, make generalizations from patterns, and test these generalizations. Deductive reasoning occurs when students reach new conclusions based upon what is already known or assumed to be true.

Visualization [V]
The use of visualization in the study of mathematics provides students with opportunities to understand mathematical concepts and make connections among them. Visual images and visual reasoning are important components of number sense, spatial sense, and logical thinking. Number visualization occurs when students create mental representations of numbers and visual ways to compare those numbers.

Technology [T]
Technology tools contribute to student achievement of a wider range of mathematics outcomes, and enable students to explore and create
patterns, examine relationships, test conjectures, and solve problems. Calculators, computers, and other forms of technology can be used to:

- explore and demonstrate mathematical relationships and patterns
- organize and display data
- extrapolate and interpolate
- assist with calculation procedures as part of solving problems
- decrease the time spent on computations when other mathematical learning is the focus
- reinforce the learning of basic facts and test properties
- develop personal procedures for mathematical operations
- create geometric displays
- simulate situations
- develop number sense
- develop spatial sense
- develop and test conjectures.

Technology contributes to a learning environment in which the growing curiosity of students can lead to rich mathematical discoveries at all grade levels. It is important for students to understand and appreciate the appropriate use of technology in a mathematics classroom. It is also important that students learn to distinguish between when technology is being used appropriately and when it is being used inappropriately. Technology should never replace understanding, but should be used to enhance it.

**Discovering versus Covering**

Teaching mathematics for deep understanding involves two processes: teachers covering content and students discovering content. Knowing what must be covered and what can be discovered is crucial in planning for mathematical instruction and learning. The content that needs to be covered (what the teacher needs to explicitly tell the students) is the social conventions or customs of mathematics. This content includes things such as what the symbol for an operation looks like, mathematical terminology, and conventions regarding recording of symbols and quantities.

The content that can and should be discovered by students is the content that can be constructed by students based on their prior mathematical knowledge. This content includes things such as strategies, processes, rules, and problem solving, as well as the students’ current and intuitive understandings of quantity, patterns, and shapes. Any learning in mathematics that is a consequence of the logical structure of mathematics can and should be constructed by students.
For example, when learning about outcome FP10.4:

Develop and apply the primary trigonometric ratios (sine, cosine, tangent) to solve problems that involve right triangles.

students can explore, describe, and generalize the trigonometric relationships from within similar right triangles. In addition, they can explore non-right triangles to determine that these same relationships do not hold in those cases. What the teacher needs to cover, once the students are recognizing and working with the ratios, is the mathematical names of the different ratios (sine, cosine, tangent and even cosine, cosecant, and cotangent), as well as the words used to describe the relationship between a side in a right triangle and an angle in that same triangle (adjacent, opposite, and hypotenuse).

**Development of Mathematical Terminology**

Part of learning mathematics is learning how to communicate mathematically. Teaching students mathematical terminology when they are learning for deep understanding requires that the students connect the new terminology with their developing mathematical understanding. As a result, it is important that students first linguistically engage with new mathematical concepts using words that they already know or that make sense to them.

For example, in Outcome FP10.6:

Expand and apply understanding of relations and functions including:

- relating data, graphs, and situations
- analyzing and interpreting
- distinguishing between relations and functions.

students need to be given a chance to explore and differentiate between relations and functions, such as through concept attainment, before the terminology and any definitions are given by the teacher. Meaningful construction and understanding of mathematical terminology by students involves the students, individually and then as a group, negotiating with the teacher the definitions to be used within the class. At that point, the students are then prepared to consider published definitions and to read and critique them.

In helping students develop their working mathematical language, it is also important for the teachers to recognize that for many students, including First Nations and Métis, they may not recognize a specific term or procedure, but the student may in fact have a deep understanding of the mathematical topic. Many perceived learning difficulties in mathematics are the result of students' cultural and personal ways of knowing not being connected to formal mathematical language.

*Teachers should model appropriate conventional vocabulary.*

*(NCTM, 2000, p. 131)*
In addition, the English language often allows for multiple interpretations of the same sentence, depending upon where the emphasis is placed. For example, consider the sentence “The shooting of the hunters was terrible” (Paulos, 1980, p. 65). Were the hunters that bad of a shot, was it terrible that the hunters got shot, was it terrible that they were shooting, or is this all about the photographs that were taken of the hunters? It is important that students be engaged in dialogue through which they explore possible meanings and interpretations of mathematical statements and problems.

First Nations and Métis Learners and Mathematics

It is important for teachers to realize that First Nations and Métis students, like all students, come to mathematics classes with a wealth of mathematical understandings. Within these mathematics classes, some First Nations and Métis students may develop a negative sense of their ability in mathematics and, in turn, do poorly on mathematics assessments. Such students may become alienated from mathematics because it is not taught to their schema, cultural and environmental context, or real life experiences. A first step in actualization of mathematics from First Nations and Métis perspectives is to empower teachers to understand that mathematics is not acultural. As a result, teachers realize that the traditional ways of teaching the mathematics are also culturally-biased. These understandings will support the teacher in developing First Nations and Métis students’ personal mathematical understandings and mathematical self-confidence and ability through a more holistic and constructivist approach to learning. Teachers need to pay close attention to the factors that impact the success of First Nations and Métis students in mathematics: cultural contexts and pedagogy.

It is important for teachers to recognize the influence of cultural contexts on mathematical learning. Educators need to be sensitive to the cultures of others, as well as to how their own cultural background influences their current perspective and practice. Mathematics instruction focuses on the individual parts of the whole understanding and, as a result, the contexts presented tend to be compartmentalized and treated discretely. This focus on parts may be challenging for students who rely on whole contexts to support understanding.

Mathematical ideas are valued, viewed, contextualized, and expressed differently by cultures and communities. Translation of these mathematical ideas between cultural groups cannot be assumed to be a direct link. Consider, for example, the concept of “equal”, which is a key understanding in this curriculum. The Western understanding of “equal” is “the same”. In many First Nations and Métis communities, however, “equal” is understood as meaning “for the good of the community”. Teachers need to support students in uncovering these differences in ways of knowing and understanding within

For some First Nations and Métis students, the word “equal” may carry the cultural understanding of being “for the good of the community”. For example, “equal” sharing of the meat from a hunt may not mean that everyone gets the same amount.
the mathematics classroom. Various ways of knowing need to be celebrated to support the learning of all students.

Along with an awareness of students' cultural context, pedagogical practices also influence the success of First Nations and Métis students in the mathematics classroom. Mathematical learning opportunities need to be holistic, occurring within social and cultural interactions through dialogue, language, and the negotiation of meanings. Constructivism, ethnomathematics, and teaching through an inquiry approach are supportive of a holistic perspective to learning. Constructivism, inquiry learning, and ethnomathematics allow students to enter the learning process according to their ways of knowing, prior knowledge, and learning styles. Ethnomathematics also shows the relationship between mathematics and cultural anthropology.

Individually, and as a class, teachers and students need to explore the big ideas that are foundational to this curriculum and investigate how those ideas relate to themselves personally and as a learning community. Mathematics learned within contexts that focus on the day-to-day activities found in students' communities support learning by providing a holistic focus. Mathematics needs to be taught using the expertise of elders and the local environment as educational resources. The variety of interactions that occur among students, teachers, and the community strengthen the learning experiences for all.

**Critiquing Statements**

One way to assess students' depth of understanding of an outcome is to have the students critique a general statement which, on first reading, may seem to be true or false. By having students critique such statements, the teacher is able to identify strengths and deficiencies in their understanding. Some indicators in this curriculum are examples of statements that students can analyze for accuracy. For example, consider the indicator:

Critique the statement “any straight line is the graph of a linear function.”

Often, students begin to think that the words “linear function” and “straight line” are synonymous. Although it is true that a linear function has a straight line graph, the converse is not true. Some straight lines represent linear relations which are not linear functions. There are two important learnings from this critique statement: differentiating between linear relations and linear functions, and recognizing that even though a statement may be mathematically true, its converse need not be.

Critiquing statements is an effective way to assess students individually, as a small group, or as a large group. When engaged as a group, the discussion and strategies that emerge not only inform the
It is important for students to use representations that are meaningful to them.  
(NCTM, 2000, p. 140)

A major responsibility of teachers is to create a learning environment in which students’ use of multiple representations is encouraged.  
(NCTM, 2000, p. 139)

teacher, but also engage all of the students in a deeper understanding of the topic.

The Concrete to Abstract Continuum

It is important, in learning mathematics, that students be allowed to explore and develop understandings by moving along a concrete to abstract continuum. As understanding develops, this movement along the continuum is not necessarily linear. Students may at one point be working abstractly but when a new idea or context arises, they need to return to a more concrete starting point. Therefore, teachers must be prepared to engage students at different points along the continuum.

In addition, what is concrete and what is abstract is not always obvious and can vary according to the thinking processes of the individual. As well, teachers need to be aware that different aspects of a task might involve different levels of concreteness or abstractness. Consider the following situational question involving surface area: What is the surface area of your computer? Depending upon how the question is expected to be solved (or if there is any specific expectation), this question can be approached abstractly (using symbolic number statements), concretely (e.g., using manipulatives, pictures), or both.

Models and Connections

New mathematics is continuously developed by creating new models as well as combining and expanding existing models. Although the final products of mathematics are most frequently represented by symbolic models, their meaning and purpose is often found in the concrete, physical, pictorial, and oral models and the connections between them.

To develop a deep and meaningful understanding of mathematical concepts, students need to represent their ideas and strategies using a variety of models (concrete, physical, pictorial, oral, and symbolic). In addition, students need to make connections between the different representations. These connections are made by having the students try to move from one type of representation to another ("How could you write what you've done here using mathematical symbols?") or by having students compare their representations with others in the class.

In making these connections, students should be asked to reflect upon the mathematical ideas and concepts that are being used in their new models.

Making connections also involves looking for patterns. For example, in outcome FP10.8:

Demonstrate understanding of linear relations including:

• representing in words, ordered pairs, tables of values, graphs, function notation, and equations
• determining characteristics including intercepts, slope, domain, and range
• relating different equation forms to each other and to graphs.

Students are learning that when an equation for a relation is written in the form \( y = mx + b \), the slope and y-intercept values for the graph of the relation can be read directly from the equation. Students can construct this knowledge by being engaged in graphing relations, with or without the use of technology, and connecting through comparison the characteristics of the graph (such as the slope and the y-intercept) to the numerical coefficients in the equation.

**Role of Homework**

The role of homework in teaching for deep understanding is important. Students should be given unique problems and tasks that help to consolidate new learnings with prior knowledge, explore possible solutions, and apply learning to new situations. Although drill and practice does serve a purpose in learning for deep understanding, the amount and timing of drill will vary among different learners. In addition, when used as homework, drill and practice frequently causes frustration, misconceptions, and boredom to arise in students.

As an example of the type or style of homework that can be used to help students develop deep understanding of Foundations of Mathematics and Pre-calculus 10, consider outcome FP10.5:

- Demonstrate understanding of the multiplication and factoring of polynomial expressions (concretely, pictorially, and symbolically) including:
  - multiplying of monomials, binomials, and trinomials
  - common factors
  - trinomial factoring
  - relating multiplication and factoring of polynomials.

Before starting to look at different types of factoring, the students can be given a homework task to sort, in any way that makes sense to them, a set of expressions (which happen to all be expressions that can be factored). This will engage the students in thinking and looking deeply at the expressions and for their defining characteristics, which is an important skill needed for the students to learn to decide how to factor an expression. The students would then bring their sorting of the expressions to class and have a partner or small group try to work out the sorting rule(s) used by each person. A random selection of the sorts could then be shared with the entire class to discuss, followed by the teachers’ sorting of the expressions (by type(s) of factoring). The class would then engage in an inquiry into what sorting rule(s) the teacher used, thus getting the students familiar with what to look

**Characteristics of Good Math Homework**

- It is accessible to [students] at many levels.
- It is interesting both to [students] and to any adults who may be helping.
- It is designed to provoke deep thinking.
- It is able to use concepts and mechanics as means to an end rather than as ends in themselves.
- It has problem solving, communication, number sense, and data collection at its core.
- It can be recorded in many ways.
- It is open to a variety of ways of thinking about the problem although there may be one right answer.
- It touches upon multiple strands of mathematics, not just number.
- It is part of a variety of approaches to, and types of, math homework offered to [students] throughout the year.

(Adapted from Raphel, 2000, p. 75)
for when factoring before they have begun to learn about factoring. This could then be followed by the naming of the different sets (e.g., difference of squares or binomial squares). Future homework could include the expanding of different sets of factors to look for patterns and connections between the factors and the expanded forms.

**Ongoing Feedback and Reflection**

Ongoing feedback and reflection, both for students and teachers, are crucial in classrooms when learning for deep understanding. Deep understanding requires that both the teacher and students need to be aware of their own thinking as well as the thinking of others.

Feedback from peers and the teacher helps students rethink and solidify their understandings. Feedback from students to the teacher gives much needed information in the teacher’s planning for further and future learnings.

Self-reflection, both shared and private, is foundational to students developing a deep understanding of mathematics. Through reflection tasks, students and teachers come to know what it is that students do and do not know. It is through such reflections that not only can a teacher make better informed instructional decisions, but also that a student can set personal goals and make plans to reach those goals.

**Teaching for Deep Understanding**

For deep understanding, it is vital that students learn by constructing knowledge, with very few ideas being relayed directly by the teacher. As an example, function notation is something which the teacher will have to show and name for the students; however, first, the students could explore the ideas important for working with function notation.

It is important for teachers to analyze the outcomes to identify what students need to know, understand, and be able to do. Teachers also need to consider opportunities for students to explain, apply, and transfer understanding to new situations. This reflection supports professional decision making and planning effective strategies to promote students’ deeper understanding of mathematical ideas.

It is important that a mathematics learning environment include effective interplay of:

- reflection
- exploring of patterns and relationships
- sharing ideas and problems
- considering of different perspectives
- decision making
- generalizing

---

*Feedback can take many different forms. Instead of saying, “This is what you need to do,” we can ask questions: “What do you think you need to do? What other strategy choices could you make? Have you thought about...?” (Stiff, 2001, p. 70)*

*Not all feedback has to come from outside – it can come from within. When adults assume that they must be the ones who tell students whether their work is good enough, they leave them handicapped, not only in testing situations (such as standardized tests) in which they must perform without guidance, but in life itself. (NCTM, 2000, p. 72)*

*A simple model for talking about understanding is that to understand something is to connect it with previous learning or other experiences ... A mathematical concept can be thought of as a network of connections between symbols, language, concrete experiences, and pictures. (Haylock & Cockburn, 2003, p. 18)*
• verifying and proving
• modeling and representing.

Mathematics is learned when students are engaged in strategic play with mathematical concepts and differing perspectives. When students learn mathematics by being told what to do, how to do it, and when to do it, they cannot make the strong connections necessary for learning to be meaningful, easily accessible, and transferable. The learning environment must be respectful of individuals and groups, fostering discussion and self-reflection, the asking of questions, the seeking of multiple answers, and the construction of meaning.

**Inquiry**

Inquiry learning provides students with opportunities to build knowledge, abilities, and inquiring habits of mind that lead to deeper understanding of their world and human experience. The inquiry process focuses on the development of compelling questions, formulated by teachers and students, to motivate and guide inquiries into topics, problems, and issues related to curriculum content and outcomes.

Inquiry is more than a simple instructional method. It is a philosophical approach to teaching and learning, grounded in constructivist research and methods, which engages students in investigations that lead to disciplinary and transdisciplinary understanding.

Inquiry builds on students’ inherent sense of curiosity and wonder, drawing on their diverse backgrounds, interests, and experiences. The process provides opportunities for students to become active participants in a collaborative search for meaning and understanding. Students who are engaged in inquiry:

• construct deep knowledge and deep understanding rather than passively receiving it
• are directly involved and engaged in the discovery of new knowledge
• encounter alternative perspectives and conflicting ideas that transform prior knowledge and experience into deep understanding
• transfer new knowledge and skills to new circumstances
• take ownership and responsibility for their ongoing learning of curriculum content and skills.

(Adapted from Kuhlthau & Todd, 2008, p. 1)

Inquiry learning is not a step-by-step process, but rather a cyclical process, with parts of the process being revisited and rethought as a result of students’ discoveries, insights, and construction of new knowledge. The following graphic shows the cyclical inquiry process.

What might you hear or see in a Grade 10 classroom that would indicate to you that students were developing a deep understanding?

Inquiry is a philosophical stance rather than a set of strategies, activities, or a particular teaching method. As such, inquiry promotes intentional and thoughtful learning for teachers and children.

(Mills & Donnelly, 2001, p. xviii)
Inquiry prompts and motivates students to investigate topics within meaningful contexts. The inquiry process is not linear or lock-step, but is flexible and recursive. Experienced inquirers move back and forth through the cyclical process as new questions arise and as students become more comfortable with the process.

Well-formulated inquiry questions are broad in scope and rich in possibilities. They encourage students to explore, gather information, plan, analyze, interpret, synthesize, problem solve, take risks, create, conclude, document, and reflect on learning, and develop new questions for further inquiry.

In mathematics, inquiry encompasses problem solving. Problem solving includes processes to get from what is known to discover what is unknown. When teachers show students how to solve a problem and then assign additional problems that are similar, the students are not problem solving but practising. Both are necessary in mathematics, but one should not be confused with the other. If the path for getting to the end situation has already been determined, it is no longer problem solving. Students must understand this difference too.
Creating Questions for Inquiry in Mathematics

Teachers and students can begin their inquiry at one or more curriculum entry points; however, the process may evolve into transdisciplinary integrated learning opportunities, as reflective of the holistic nature of our lives and interdependent global environment. It is essential to develop questions that are evoked by students’ interests and have potential for rich and deep learning. Compelling questions are used to initiate and guide the inquiry, and give students direction for discovering deep understandings about a topic or issue under study.

The process of constructing inquiry questions can help students to grasp the important disciplinary or transdisciplinary ideas that are situated at the core of a particular curricular focus or context. These broad questions will lead to more specific questions that can provide a framework, purpose, and direction for the learning activities in a lesson, or series of lessons, and help students connect what they are learning to their experiences and life beyond school.

Effective questions in mathematics are the key to initiating and guiding students’ investigations, critical thinking, problem solving, and reflection on their own learning. Questions such as:

- “When or why might you want to factor a polynomial?”
- “How do you know when you have an answer?”
- “Will this strategy work for all situations?”
- “How does your representation compare to that of your partner?”

are examples of questions that will move students’ inquiry towards deeper understanding. Effective questioning is essential for teaching and student learning, and should be an integral part of planning. Questioning should also be used to encourage students to reflect on the inquiry process and on the documentation and assessment of their own learning.

Questions should invite students to explore mathematical concepts within a variety of contexts and for a variety of purposes. When questioning students, teachers should choose questions that:

- help students make sense of the mathematics.
- are open-ended, whether in answer or approach. There may be multiple answers or multiple approaches.
- empower students to unravel their misconceptions.
- not only require the application of facts and procedures but encourage students to make connections and generalizations.
- are accessible to all students in their language and offer an entry point for all students.

Effective questions:

- cause genuine and relevant inquiry into the important ideas and core content
- provide for thoughtful, lively discussion, sustained inquiry, and new understanding as well as more questions
- require students to consider alternatives, weigh evidence, support their ideas, and justify their answers
- stimulate vital, ongoing rethinking of key ideas, assumptions, and prior lessons
- spark meaningful connections with prior learning and personal experiences
- naturally recur, creating opportunities for transfer to other situations and subjects.

(Wiggins & McTighe, 2005, p. 110)
• lead students to wonder more about a topic and to perhaps construct new questions themselves as they investigate this newly found interest.

(Schuster & Canavan Anderson, 2005, p.3)

Reflection and Documentation of Inquiry

An important part of any inquiry process is student reflection on their learning and the documentation needed to assess the learning and make it visible. Student documentation of the inquiry process in mathematics may take the form of reflective journals, notes, models, works of art, photographs, or video footage. This documentation should illustrate the students’ strategies and thinking processes that led to new insights and conclusions. Inquiry-based documentation can be a source of rich assessment materials through which teachers can gain a more in-depth look into their students’ mathematical understandings.

It is important that students are required to engage in the communication and representation of their progress within a mathematical inquiry. A wide variety of forms of communication and representation should be encouraged and, most importantly, have links made between them. In this way, student inquiry into mathematical concepts and contexts can develop and strengthen student understanding.

As teachers of mathematics, we want our students not only to understand what they think but also to be able to articulate how they arrived at those understandings.

(Schuster & Canavan Anderson, 2005, p. 1)
Outcomes and Indicators

Goals: Number Sense, Logical Thinking, Mathematics as a Human Endeavour

Outcomes
FP10.1 Demonstrate understanding of factors of whole numbers by determining the:
• prime factors
• greatest common factor
• least common multiple
• principal square root
• cube root.
[CN, ME, R]

Indicators
a. Develop, generalize, explain, and apply strategies for determining the greatest common factors or least common multiples.
b. Explain the relationship between factors and multiples.
c. Determine the prime factors of a whole number and explain the strategies used.
d. Analyze concretely, pictorially, or numerically and explain whether a whole number is a perfect square or a perfect cube.
e. Develop, generalize, explain, and apply strategies for determining the square root of a perfect square and the cube root of a perfect cube.
f. Investigate and report about the numbers 0 and 1 with respect to factors, multiples, square roots, and cube roots.
g. Solve problems that involve prime factors, greatest common factors, least common multiples, square roots, or cube roots.

Goals: Number Sense, Logical Thinking, Mathematics as a Human Endeavour

Outcomes
FP10.2 Demonstrate understanding of irrational numbers in both radical (including mixed radical) and exponent forms through:
• representing
• identifying
• simplifying
• ordering
• relating to rational numbers
• applying exponent laws.
[C, CN, ME, PS, R, V]

Indicators
a. Sort, with justification, a set of numbers into rational and irrational numbers.
b. Create and explain a pattern that describes the decimal form of an irrational number (e.g., write the digits from 0 to 9 in order, then put two of each digit – 0011223344 … – followed by three of each digit and so on).
c. Approximate the value of a given irrational number and explain the strategy used.
d. Order a set of Real numbers, including rational and irrational numbers, on a number line and explain the strategies used.
e. Express a radical as a mixed radical in simplest form (limited to numerical radicands).
f. Express a mixed radical as an entire radical (limited to numerical radicands).
g. Explain, using examples, how changing the value of the index of a radical impacts the value of the radical.
Outcomes

FP10.2 continued

h. Represent, such as through the use of a graphic organizer, the relationships among the subsets of the Real numbers: natural, whole, integer, rational, and irrational.

i. Analyze patterns to generalize why \( a^{-n} = \frac{1}{a^n}, a \neq 0 \).

j. Analyze patterns to generalize why \( a^{\frac{1}{n}} = \sqrt[n]{a}, n \neq 0, n \in \mathbb{I} \) and \( a > 0 \) when \( n \) is an even integer.

k. Extend and apply the exponent laws to powers with rational exponents (limited to expressions with rational and variable bases and integral and rational exponents):
   - \( (a^n)(a^m) = a^{n+m} \)
   - \( a^n \div a^m = a^{n-m}, a \neq 0 \)
   - \( (a^n)^m = a^{nm} \)
   - \( (ab)^n = a^n b^m \)
   - \( \left( \frac{a}{b} \right)^n = \frac{a^n}{b^n}, b \neq 0 \)

l. Analyze simplifications of expressions involving radicals and/or powers for errors.

m. Express powers with rational exponents as radicals and vice versa.

n. Create a representation that conveys the relationship between powers, rational numbers, and irrational numbers.

Goals: Number Sense, Spatial Sense, Logical Thinking, Mathematics as a Human Endeavour

Outcomes

FP10.3 Demonstrate understanding of SI and imperial units of measurement including:

- linear measurement
- surface area of spheres, and right cones, cylinders, prisms, and pyramids
- volume of spheres, and right cones, cylinders, prisms, and pyramids
- relationships between and within measurement systems.

[C, CN, ME, PS, R, V]
Outcomes
FP10.3 continued

Indicators

c. Explain the selection of measurement instruments (e.g., rulers, callipers, or tape measures) and the strategies used to determine linear measurements (e.g., circumference of a bottle, length of a curve, or perimeter of the base of an irregular 3-D object).
d. Critique the statement “the length of the wall is greater in yards than it is in metres”.
e. Compare the size of SI and imperial units of measurement (linear, surface area, and volume) using referents.
f. Develop, generalize, explain, and apply strategies and/or formulas for converting between units within the imperial or SI system of measurements, limited to linear, surface area, and volume units. (e.g., converting square feet to square yards or m$^3$ to cm$^3$).
g. Develop, generalize, explain and apply strategies and/or formulas for converting between:
   • SI and imperial units of linear, surface area, and volume measure
   • imperial and SI units of linear, surface area, and volume measure.
h. Verify, with explanation (such as unit analysis and/or mental mathematics and estimation), a conversion of units (within the SI or imperial systems of measurement or between them).
i. Analyze 3-D objects, their nets, and labelled diagrams to develop and generalize strategies and/or formulas for determining the surface area and volume of right cones, cylinders, prisms, and pyramids and composite objects.
j. Solve, using personal strategies and/or formulas, situational questions related to surface area, volume, and dimensions of right cones, cylinders, prisms, and pyramids, and composite 3-D objects.
k. Apply formulas to determine the surface area and/or volume of spheres.
l. Explain the relationship between the volumes of:
   • right cones and right cylinders with the same base and height
   • right pyramids and right prisms with the same base and height.
m. Analyze a treaty for its inclusion of measurements, such as in the surveying for land entitlement, and create and solve situational questions that are relevant to self, family, and community.
### Goals: Number Sense, Spatial Sense, Logical Thinking, Mathematics as a Human Endeavour

**Outcomes**

FP10.4 Develop and apply the primary trigonometric ratios (sine, cosine, tangent) to solve problems that involve right triangles.

[C, CN, PS, R, T, V]

**Indicators**

- Develop, generalize, explain, and apply relationships between the ratios of side lengths and angle sizes in similar right triangles.
- Demonstrate how to identify the hypotenuse of a right triangle and the adjacent and opposite sides to an acute angle in that right triangle.
- Solve problems, with or without the use of technology, involving one or more right triangles by applying primary trigonometric ratios and/or the Pythagorean Theorem.
- Create and solve problems that involve indirect and direct linear measurements by using the primary trigonometric ratios, the Pythagorean Theorem, and measurement instruments such as a clinometer or metre stick.

**Outcomes**

FP10.5 Demonstrate understanding of the multiplication and factoring of polynomial expressions (concretely, pictorially, and symbolically) including:

- multiplying of monomials, binomials, and trinomials
- common factors
- trinomial factoring
- relating multiplication and factoring of polynomials.

[C, CN, R, V]

**Indicators**

(\textit{It is intended that the emphasis of this outcome be on binomial by binomial multiplication, with extension to polynomial by polynomial to establish a general pattern for multiplication.})

- Develop, generalize, explain, and apply a strategy of symbolic manipulation to determine the product of two binomials by analyzing concrete and pictorial models.
- Explain the relationship between the multiplication of two binomial expressions and the area of a rectangular region.
- Develop (concretely, pictorially, or symbolically), explain, and apply understanding of how multiplication of binomials is related to the multiplication of two-digit numbers (e.g., use algebra tiles and base ten blocks to compare and relate the products of \((x+1)(3x+2)\) and \((11)(32)\)).
- Develop, generalize, explain, and apply a strategy for multiplying polynomials.
- Analyze the multiplication of two polynomials for errors and explain the strategy used.
- Explain why evaluating at a value for the variable in a product of polynomials in factored form should give the same solution as evaluating the expanded and simplified form of the polynomial product at the same value (e.g., explain why \(x^2+5x+6\) should have the same value as \((x+3)(x+2)\) when evaluated at \(x = -4\)).
- Explain, using concrete or visual models, how the processes of factoring and multiplication are related.
Outcomes

FP10.5 continued

Outcomes

FP10.6 Expand and apply understanding of relations and functions including:

- relating data, graphs, and situations
- analyzing and interpreting
- distinguishing between relations and functions.

[C, CN, R, T, V]

<table>
<thead>
<tr>
<th>Indicators</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Provide and discuss examples of different types of relations relevant to one’s life, family, or community (e.g., person A is the mother of person B, or person A is a brother of person B.).</td>
</tr>
</tbody>
</table>
| b. Explain, by providing situational and graphical examples, the relationship between the categories of “relations” and “functions”.

Note: For some First Nations and Métis, the way relations are defined might be at a more specific level. For example, for some Ojibway a word for “brother” does not exist, only “older brother” and “younger brother”.

c. Critique the statement “Relations and functions are the same thing”.

d. Graph, with or without technology, a set of data, and determine the restrictions on the domain and range.

e. Explain why data points should or should not be connected on the graph for a situation.

f. Provide and explain examples of situations that could be represented by a given graph.

g. Sketch a graph to represent a situation presented orally or in writing.

h. Determine, and express in a variety of ways, the domain and range of a graph, a set of ordered pairs, or a table of values.
Outcomes

FP10.6 continued

Indicators

i. Generalize, explain, and apply strategies for determining whether a set of ordered pairs or a graph represents a function.

Goals: Number Sense, Spatial Sense, Logical Thinking, Mathematics as a Human Endeavour

Outcomes

FP10.7 Demonstrate, with and without the use of technology, understanding of slope (concretely, pictorially, and symbolically) with respect to:

- line segments and lines
- rate of change
- ratio of rise to run
- parallel lines
- perpendicular lines.

[PS, R, V]

Indicators

a. Provide examples, relevant to self, family, or community, to explain the importance of slope.

b. Illustrate and explain, using examples relevant to self, family, or community, how slope is rate of change.

c. Determine the slope of a line segment by using the measurement or calculation of the rise and run.

d. Classify lines in a given set as having positive or negative slopes, and explain how the sign of the slope affects the interpretation or meaning of the slope.

e. Explain the meaning of zero or slopes with no Real value.

f. Explain why the slope of a straight line can be determined by using any two distinct points on that line.

g. Draw a line given its slope and a point on the line.

h. Determine another point on a line, given the slope and a point on the line.

i. Generalize, explain, and apply strategies for determining whether two lines are parallel or perpendicular.

j. Apply knowledge and skills related to slope to solve situational questions relevant to self, family, and community (e.g., determine the slopes of the poles in a tepee and the impact of changing the slopes on the dimensions and strength of the tepee).

Goals: Number Sense, Spatial Sense, Logical Thinking, Mathematics as a Human Endeavour

Outcomes

FP10.8 Demonstrate understanding of linear relations including:

- representing in words, ordered pairs, tables of values, graphs, function notation, and equations

Indicators

a. Critique the statement “any straight line is the graph of a linear function”.

b. Explain, using examples, the impact of the domain of a linear function on the graph of the function (e.g., if the domain is not all Real numbers, then the graph will not show a solid line).

c. Analyze situations to identify, with justification, the independent and a dependent variable.

d. Analyze situations, graphs, tables of values, equations, or sets of ordered pairs to determine if the relationship described is linear.
Outcomes

FP10.8 continued
- determining characteristics including intercepts, slope, domain, and range
- relating different equation forms to each other and to graphs.

[C, CN, PS, R, T, V]

Indicators

e. Match corresponding types of representations of linear relations (e.g., situations, graphs, tables of values, equations, and sets of ordered pairs).
f. Develop, generalize, explain, and apply strategies for determining the intercepts (as values and ordered pairs) of a linear relation from its graph.
g. Determine the slope, domain, and range of the graph of a linear relation.
h. Sketch examples of linear relations to demonstrate the number of x or y intercepts possible for any line.
i. Match, with explanation, slopes and y-intercepts to graphs of linear relations.
j. Solve a situational question that involves the intercepts, slope, domain, or range of a linear relation.
k. Express the equation of a linear relation in different forms (including the slope-intercept or general form) and compare the graphs of the linear relations.
l. Generalize, explain, and apply strategies for drawing or sketching the graph of a linear relation in slope-intercept, general, or slope-point form, or function notation.
m. Graph, with and without technology, a linear relation given in slope-intercept, general, or slope-point form, and explain the strategy used to create the graph.
n. Analyze a set of linear relations for equivalent linear relations (e.g., $2x + 3y = 6$ is equivalent to $4x + 6y = 12$) and explain the reasoning.
o. Explain the relationship between linear functions written in function notation and written as equations with two variables, and how to change between the two forms.
p. Apply knowledge and skills related to function notation to solve situational questions.
q. Determine the related range value, given a domain value for a linear function (e.g., if $f(x) = 3x - 2$, determine $f(-1)$) and explain what the resulting value tells about the linear function.
r. Determine the related domain value, given a range value for a linear function (e.g., if $g(t) = 7 + t$, determine $t$ so that $g(t) = 15$) and explain what the resulting value tells about the linear function.
s. Explain why a linear function would never have a term of $x^2$ when in simplified form.
Goals: Number Sense, Spatial Sense, Logical Thinking, Mathematics as a Human Endeavour

### Outcomes

**FP10.9 Demonstrate understanding of the writing and application of equations of linear relations, given:**
- a graph of a relation
- a point that satisfies a relation and the slope of the relation
- two distinct points that satisfy a relation
- a point that satisfies the relation and the equation of a line parallel or perpendicular to the relation.

Assessment and Evaluation of Student Learning

Assessment and evaluation require thoughtful planning and implementation to support the learning process and to inform teaching. All assessment and evaluation of student achievement must be based on the outcomes in the provincial curriculum.

Assessment involves the systematic collection of information about student learning with respect to:

- Achievement of provincial curriculum outcomes
- Effectiveness of teaching strategies employed
- Student self-reflection on learning.

Evaluation compares assessment information against criteria based on curriculum outcomes for the purpose of communicating to students, teachers, parents/caregivers, and others about student progress and to make informed decisions about the teaching and learning process.

Reporting of student achievement must be in relation to curriculum outcomes. Assessment information which is not related to outcomes can be gathered and reported (e.g., attendance, behaviour, general attitude, completion of homework, effort) to complement the reported achievement related to the outcomes of Foundations of Mathematics and Pre-calculus 10. There are three interrelated purposes of assessment. Each type of assessment, systematically implemented, contributes to an overall picture of an individual student’s achievement.

**Assessment for learning** involves the use of information about student progress to support and improve student learning and inform instructional practices, and:

- is teacher-driven for student, teacher, and parent use
- occurs throughout the teaching and learning process, using a variety of tools
- engages teachers in providing differentiated instruction, feedback to students to enhance their learning, and information to parents in support of learning.

**Assessment as learning** involves student reflection on and monitoring of her/his own progress related to curricular outcomes and:

- is student-driven with teacher guidance for personal use
- occurs throughout the learning process
- engages students in reflecting on learning, future learning, and thought processes (metacognition).

Assembling evidence from a variety of sources is more likely to yield an accurate picture.

(NCTM, 2000, p. 24)

Assessment should not merely be done to students; rather it should be done for students.

(NCTM, 2000, p. 22)

What are examples of assessments as learning that could be used in Foundations of Mathematics and Pre-calculus 10 and what would be the purpose of those assessments?
Assessment should become a routine part of the ongoing classroom activity rather than an interruption. (NCTM, 2000, p. 23)

Assessment of learning involves teachers’ use of evidence of student learning to make judgements about student achievement and:

- provides opportunity to report evidence of achievement related to curricular outcomes
- occurs at the end of a learning cycle, using a variety of tools
- provides the foundation for discussion on placement or promotion.

In mathematics, students need to be regularly engaged in assessment as learning. The various types of assessments should flow from the learning tasks and provide direct feedback to the students regarding their progress in attaining the desired learnings as well as opportunities for the students to set and assess personal learning goals related to the content of Foundations of Mathematics and Pre-calculus 10.
Glossary

**Direct Measurement**: Measurement obtained by physically using a measurement tool, such as a metre stick, thermometer, or scale, on the object or quantity being measured.

**Function**: A special type of relation which exists between each number in one set and just one number in a second set. The first set is referred to as the domain of the function, while the second set is called the range of the function.

**Generalize**: The process of describing in general patterns and/or processes from specific examples and cases. Frequently, generalizing is an inductive process but it can also involve deductive proof of the pattern or process.

**Graphic Organizer**: A pictorial or concrete representation of knowledge, concepts, and/or ideas and connections among them.

**Indirect Measurement**: The use of proportions and proportional relationships, such as similar triangles, the Pythagorean Theorem, and the trigonometric ratios, to determine a measurement that cannot or has not been measured directly. It is the determining of a measurement based on other known measurements rather than by physically measuring.

**Referent**: A personally determined concrete or physical approximation of a quantity or unit of measurement. For example, some people use the width of their thumb as a referent for one inch.

**Relation**: A description of how two sets of things can be connected to each other.
